GLOSSARY

KEY TERMS

Aperture:

An opening through which light travels such as a window or wall opening.

Baffle:

An opaque or translucent element that serves to shield a light source from direct view at certain angles, or serves to absorb unwanted light.

Beam Angle:

The diameter of the patter of light produced by a lamp, or lamp and luminaire together.

Bin:

The way of measuring LEDs colour, flux and forward voltage to deliver to the market in subclasses or groups called bins.

Cable Voltage Drop:

A reduction in electrical pressure in a cable resulting from increasing distance from the power source or increased power drawn along the cable.

Colour Rendering Index (CRI):

A quantitative measure of the ability of a light source to reveal the colours of various objects.

Correlated Colour Temperature (CCT):

Colour temperature is a way to describe the light appearance provided by a lamp. It is measured in degrees of Kelvin.

Driver:

An electronic power supply required to power an LED source.

Low-voltage Lighting:

A transformer is used to help convert the voltage to a lower level.

Lumen (Lm):

A measure of the total amount of visible light emitted by a source. Lumens are related to lux in that one lux is one lumen per square metre.

Spreader Lens:

A glass lens used to diffuse and widen or elongate light beam patterns.
